Background Art

Vasopressin is a 9 amino acid peptide mainly produced by the paraventricular nucleus of the hypothalamus. In the periphery vasopressin acts as a neurohormone and stimulates vasoconstriction, glycogenolysis and antidiuresis.

Three vasopressin receptors, all belonging to the class I G-protein coupled receptors, are known. The V1a receptor is expressed in the brain, liver, vascular smooth muscle, lung, uterus
and testis, the V1b or V3 receptor is expressed in the brain and pituitary gland, the V2 receptor is expressed in the kidney where it regulates water reabsorption and mediates the antidiuretic effects of vasopressin (Robben, et al. (2006). Am J Physiol Renal Physiol. 291, F257-70, "Cell biological aspects of the vasopressin type-2 receptor and aquaporin 2 water channel in nephrogenic diabetes insipidus"). Compounds with activity at the V2 receptor may therefore cause side-effects on blood homeostasis.

The oxytocin receptor is related to the Vasopressin receptor family and mediates the effects of the neurohormone oxytocin in the brain and the periphery. Oxytocin is believed to have central anxiolytic effects (Neumann (2008). J Neuroendocrinol. 20, 858-65, "Brain oxytocin: a key regulator of emotional and social behaviours in both females and males"). Central oxytocin receptor antagonism might therefore lead to anxiogenic effects, which are regarded as undesired side-effects.

In the brain vasopressin acts as a neuromodulator and is elevated in the amygdala during stress (Ebner, et al. (2002). Eur J Neurosci. 15, 384-8., "Forced swimming triggers vasopressin release within the amygdala to modulate stress-coping strategies in rats"). It is known that stressful life events can trigger major depression and anxiety (Kendler, et al. (2003). Arch Gen Psychiatry. 60, 789-96, "Life Event Dimensions of Loss, Humiliation, Entrapment, and Danger in the Prediction of Onsets of Major Depression and Generalized Anxiety") and that both have very high comorbidity, with anxiety often preceding major depression (Regier, et al. (1998). Br J Psychiatry Suppl. 24-8, "Prevalence of anxiety disorders and their comorbidity with mood and addictive disorders"). The V1a receptor is extensively expressed in the brain and particularly in limbic areas like the amygdala, lateral septum and hippocampus which are playing an important role in the regulation of anxiety. Indeed V1a knock-out mice show a reduction in anxious behavior in the plus-maze, open field and light-dark box (Bielsky, et al. (2004). Neurropsychopharmacology. 29, 483-93, "Profound impairment in social recognition and reduction in anxiety-like behavior in vasopressin V1a receptor knockout mice"). The downregulation of the V1a receptor using antisense oligonucleotide injection in the septum also causes a reduction in anxious behavior (Landgraf, et al. (1995). Regul Pept. 59, 229-39., "V1 vasopressin receptor antisense oligodeoxynucleotide into septum reduces vasopressin binding, social discrimination abilities, and anxiety-related behavior in rats"). Vasopressin or the V1a receptor are also implicated in other neuropsychological disorders: genetic studies recently linked sequence polymorphism in the promoter of the human V1a receptor to autistic spectrum disorders (Yirmiya, et al. (2006). 11, 488-94, "Association between the arginine vasopressin 1a receptor (AVPR1a) gene and autism in a family-based study: mediation by socialization skills"). Intranasal administration of vasopressin was shown to influence aggression in human males (Thompson, et al. (2004). Psychoneuroendocrinology. 29, 35-48, "The effects of vasopressin on human facial responses related to social communication") and vasopressin levels were found to be elevated in schizophrenic patients (Raskind, et al. (1987). Biol Psychiatry. 22, 453-62,

The V1a receptor is also mediating the cardiovascular effects of vasopressin in the brain by centrally regulating blood pressure and heart rate in the solitary tract nucleus (Michelini and Morris (1999). Ann N Y Acad Sci. 897, 198-211, "Endogenous vasopressin modulates the cardiovascular responses to exercise"). In the periphery it induces the contraction of vascular smooth muscles and chronic inhibition of the V1a receptor improves hemodynamic parameters in myocardial infarcted rats (Van Kerckhoven, et al. (2002). Eur J Pharmacol. 449, 135-41, "Chronic vasopressin V(1A) but not V(2) receptor antagonism prevents heart failure in chronically infarcted rats"). Hence, V1a antagonists with improved penetration through the blood-brain barrier are expected to be of advantage.

A vasopressin V1a receptor antagonist was shown to be effective in reducing dysmenorrhea in the clinic (Brouard, et al. (2000). Bjog. 107, 614-9, "Effect of SR49059, an orally active V1a vasopressin receptor antagonist, in the prevention of dysmenorrhea"). V1a receptor antagonism has also been implicated in the treatment of female sexual dysfunction (Aughton, et al. (2008). Br J Pharmacol. doi:10.1038/bjp.2008.253, "Pharmacological profiling of neuropeptides on rabbit vaginal wall and vaginal artery smooth muscle in vitro"). In a recent study V1a receptor antagonists were suggested to have a therapeutic role in both erectile dysfunction and premature ejaculation (Gupta, et al. (2008). Br J Pharmacol. 155, 118-26, "Oxytocin-induced contractions within rat and rabbit ejaculatory tissues are mediated by vasopressin V(1A) receptors and not oxytocin receptors").

**Detailed description of the invention**

It is an object of the present invention to provide compounds which act as V1a receptor modulators, and in particular as V1a receptor antagonists. It is a further object of the invention to provide selective inhibitors of the V1a receptor since it is expected that selectivity affords a low potential to cause unwanted off-target related side effects such as discussed above.

Such V1a antagonists are useful as therapeutics acting peripherally and centrally in the conditions of dysmenorrhea, male or female sexual dysfunction, hypertension, chronic heart failure, inappropriate secretion of vasopressin, liver cirrhosis, nephrotic syndrome, anxiety, depressive disorders, obsessive compulsive disorder, autistic spectrum disorders, schizophrenia, and aggressive behavior. The preferred indications with regard to the present invention are the treatment of anxiety, depressive disorders, obsessive compulsive disorder, autistic spectrum disorders, schizophrenia, and aggressive behavior.
The VIα activity may be detected as described in the pharmaceutical test section.

The invention also provides pharmaceutical compositions, methods of using, and methods of preparing the aforementioned compounds.

The compounds of formula I may contain asymmetric carbon atoms. Accordingly, the present invention includes all stereoisomeric forms of the compounds of formula I, including each of the individual stereoisomer and mixtures thereof, i.e. their individual optical isomers and mixtures thereof. Additional asymmetric centers may be present depending upon the nature of the various substituents on the molecule. Each such asymmetric centre will independently produce two optical isomers and it is intended that all of the possible optical isomers and diastereomers in mixtures and as pure or partially purified compounds are included within this invention. The present invention is meant to comprehend all such isomeric forms of these compounds. The independent syntheses of these diastereomers or their chromatographic separations may be achieved as known in the art by appropriate modification of the methodology disclosed herein. Their absolute stereochemistry may be determined by the x-ray crystallography of crystalline products or crystalline intermediates which are derivatized, if necessary, with a reagent containing an asymmetric centre of known absolute configuration. If desired, racemic mixtures of the compounds may be separated so that the individual enantiomers are isolated. The
separation can be carried out by methods well known in the art, such as the coupling of a racemic mixture of compounds to an enantiomerically pure compound to form a diastereomeric mixture, followed by separation of the individual diastereomers by standard methods, such as fractional crystallization or chromatography.

This applies in particular to the alkylcyclohexylether-head group (HG) of the compounds of formula 1, namely

Scheme 1: General Scheme A

Compounds of formula (I) can be prepared by thermal condensation of a hydrazide derivative of formula (II) and a thiolactam derivative of formula (III). The synthesis of 5 compounds of formula (II) is outlined in general schemes D-I hereinafter. Compounds of formula (III) can be prepared following the general scheme C as described hereinafter. General scheme A is hereinafter further illustrated with general procedure IV.

Scheme 2: General Scheme B Compounds of formula (I) with \( R^2 \) different from H can be prepared from compounds of formula (I-b) (compounds of formula (I) wherein \( R^2 \) is H) according to methods known in the art, e.g. by treating a compound of formula (I-b) with an inorganic base such as a carbonate salt or an organic base such as a tertiary amine and an electrophilic reactant \( R^2 \)-LG (wherein LG is a leaving group, e.g. halogen or sulfonyl) which is either commercially available or easily prepared according to methods and starting materials well known in the art. Alternatively, compounds of formula (I) can be obtained via reductive
alkylation by consecutively treating a compound of formula (I-b) with a ketone or aldehyde and a suitable reducing agent, e.g. a borohydride derivative such as sodium borohydride, sodium cyanoborohydride or sodium triacetoxyborohydride. Compounds of formula (I-b) can be obtained by cleavage of the substituent R² of compound of formula I using methods known in the art. Compounds of formula (I-b) are conveniently obtained as the salt or the free base after basic aqueous work-up by treatment of compounds of formula (I-a) (compounds of formula (I) in which R² is tert-butoxy carbonyl) with an acid in a suitable solvent, e.g. methanesulfonic acid in dichloromethane or tetrahydrofuran or hydrochloric acid in methanol. General scheme B is hereinafter further illustrated with general procedures V and VI.

Scheme 3: General Scheme C

Thiolactam derivatives of formula (III-1) (compounds of formula (III) in which R² is tert-butoxy carbonyl) can be obtained as follows: Transformation of a 2-nitrobenzyl alcohol of formula (a) to a benzylic chloride of formula (b) can be effected by a chlorinating reagent such as thionyl chloride in the presence of an organic tertiary amine base. Alkylation of a compound of formula (b) with glycine ethyl ester hydrochloride in the presence of an organic tertiary amine base and N-protection of the resulting compound of formula (c) using di-tert-butyl dicarbonate and a catalytic amount of 4-N,N-dimethylaminopyridine gives compounds of formula (d). The nitro group can be reduced selectively by hydrogenation over palladium on charcoal, which has been pretreated with a zinc halide such as zinc bromide, to give aniline intermediates of formula
(e). Cyclization to lactams of formula (f) is achieved by treatment of compounds of formula (e) with a suitable base, e.g. potassium tert-butoxide, in tetrahydrofuran. A thiolactam derivative of formula (III-1) is obtained by treatment of a compound of formula (f) with Lawesson’s reagent (2,4-bis-(4-methoxyphenyl)-1,3,2,4-dithiadiphenophonate-2,4-disulfide) or phosphorous pentasulfide at elevated temperature.

Scheme 4: General Scheme D

4-Alkoxy-cyclohexanecarboxylic acid ester derivatives of formula (VII) can be obtained by reductive etherification as follows: 4-Hydroxy-cyclohexanecarboxylic acid ethyl ester (IV) is converted to 4-trimethylsilylxy-cyclohexanecarboxylic acid ethyl ester (V) by O-silylation methods known in the art, e.g. by treatment with a silylating agent such as trimethylsilyl chloride or trimethylsilyl triflate in the presence of a base such as imidazole or 2,6-lutidine in a suitable solvent such as N,N-dimethylformamide or dichloromethane. Consecutive treatment of 4-trimethylsilylxy-cyclohexanecarboxylic acid ethyl ester (V) and a ketone or aldehyde of formula (VI) with trimethylsilyl triflate in dichloromethane and a reducing agent such as triethylsilane leads to 4-alkoxy-cyclohexanecarboxylic acid ester derivatives of formula (VII). Compounds of formula (VII) are usually obtained as a mixture of cis- and trans-isomers, which can in some cases be separated chromatographically to give the pure trans-4-alkoxy-cyclohexanecarboxylic acid ester of formula (VII-a) and cis-4-alkoxy-cyclohexanecarboxylic acid ester of formula (VII-b). General scheme D is hereinafter further illustrated by general procedure I.
Scheme 5: General Scheme E

Alternatively, 4-alkoxy-cyclohexanecarboxylic acid ester derivatives of formula (VII) can be obtained by reductive etherification as follows: Consecutive treatment of an alkoxy-trimethyl-silane of formula (IX) and 4-cyclohexanonecarboxylic acid ethyl ester (X) with trimethylsilyl triflate in dichloromethane and a reducing agent such as triethylsilane gives 4-alkoxy-cyclohexanecarboxylic acid ester derivatives of formula (VII). Compounds of formula (VII) are usually obtained as a mixture of cis- and trans-isomers, which can in some cases be separated chromatographically to give the pure trans-4-alkoxy-cyclohexanecarboxylic acid ester of formula (VII-a) and cis-4-alkoxy-cyclohexanecarboxylic acid ester of formula (VII-b).

Alkoxy-trimethyl-silane derivatives of formula (IX) are either commercially available or are prepared using O-silylation methods known in the art, e.g. by treating an alcohol of general formula (VIII) with a silylating agent such as trimethylsilyl chloride or trimethylsilyl triflate in the presence of a base such as imidazole or 2,6-lutidine in a suitable solvent such as N,N-dimethylformamide or dichloromethane. Alternatively, alkoxy-trimethyl-silane derivatives of formula (IX) can be prepared in situ without isolation prior to the reductive etherification step with 4-cyclohexanonecarboxylic acid ethyl ester (X) by treating an alcohol of general formula (VIII) with trimethylsilyl triflate and 2,6-lutidine in dichloromethane. General scheme E is hereinafter further illustrated by general procedures IIA and IIB.
Scheme 6: General Scheme F

An oxetan-3-yloxy derivatives of formula (VII-4) can be obtained by treatment of the compound of formula (VII-3) with potassium tert-butoxide in toluene at reflux. The compound of formula (VII-3) is formed by monotosylation of the dihydroxy derivative of formula (VII-2), which is prepared by hydrogenolytic double-O-debenzylolation of the compound of formula (VII-1). The compound of formula (VII-1) can be obtained from 1,3-dibenzylcyloxy-2-propanol according to the reductive etherification procedure described in general scheme E.

Scheme 7: General Scheme G

4-Trifluoromethoxy-cyclohexanecarboxylic acid ethyl ester (VII-5) can be prepared by treatment of intermediate (XI) with N-bromosuccinimide and HF-pyridine in dichloromethane.
Compound (XI) is obtained by O-deprotonation of 4-hydroxy-cyclohexanecarboxylic acid ethyl ester with sodium hydride followed by sequential addition of carbon disulfide and methyl iodide.

Scheme 8: General Scheme H

cis/trans-4-tert-Butoxy-cyclohexanecarboxylic acid ethyl ester (VII-6) can be prepared by treating cis/trans-4-hydroxy-cyclohexanecarboxylic acid ethyl ester (IV) with di-tert-butyl dicarbonate in the presence of magnesium chloride. The pure trans isomer (VII-6-a) and the pure cis isomer (VII-6-b) can be obtained by chromatographic separation.
Scheme 9: General Scheme I

A 4-aryloxy-cyclohexanecarboxylic acid ester of formula (VII) can be converted to a hydrazide derivative of formula (II) by heating with hydrazine hydrate. Alternatively, an ester derivative of formula (VII) can be hydrolyzed to a carboxylic acid derivative of formula (XII) using a biphasic mixture of aqueous sodium or potassium hydroxide solution and an ethereal solvent such as dioxan. A hydrazide derivative of formula (II) can be obtained by activating an acid intermediate of formula (XII), e.g. with ethyl chloroformate, thionyl chloride, oxalyl chloride or a peptide coupling reagent, and subsequent coupling with hydrazine. General scheme I is hereinafter further illustrated by general procedures IIIA and IIIB.

The corresponding pharmaceutically acceptable salts with acids can be obtained by standard methods known to the person skilled in the art, e.g. by dissolving the compound of formula I in a suitable solvent such as e.g. dioxan or THF and adding an appropriate amount of the corresponding acid. The products can usually be isolated by filtration or by chromatography. The conversion of a compound of formula I into a pharmaceutically acceptable salt with a base can be carried out by treatment of such a compound with such a base. One possible method to form such a salt is e.g. by addition of 1/n equivalents of a basic salt such as e.g. M(OH)_n, wherein M = metal or ammonium cation and n = number of hydroxide anions, to a solution of the compound in a suitable solvent (e.g. ethanol, ethanol-water mixture, tetrahydrofuran-water mixture) and to remove the solvent by evaporation or lyophilization.

Insofar as their preparation is not described in the examples, the compounds of formula I as well as all intermediate products can be prepared according to analogous methods or according to the methods set forth herewithin. Starting materials are commercially available, known in the art or can be prepared by methods known in the art or in analogy thereto.
It will be appreciated that the compounds of general formula I in this invention may be derivatised at functional groups to provide derivatives which are capable of conversion back to the parent compound in vivo.

**Pharmacological Tests**

The compounds of the present invention exhibit V1a activity. They are selective inhibitors of the V1a receptor and are therefore likely to have a low potential to cause unwanted off-target related side-effects. The V1a activity may be detected as described below.

The human V1a receptor was cloned by RT-PCR from total human liver RNA. The coding sequence was subcloned in an expression vector after sequencing to confirm the identity of the amplified sequence. To demonstrate the affinity of the compounds from the present invention to the human V1a receptor binding studies were performed. Cell membranes were prepared from HEK293 cells transiently transfected with the expression vector and grown in 20 liter fermenters with the following protocol.

50 g of cells are resuspended in 30 ml freshly prepared ice cold Lysis buffer (50 mM HEPES, 1 mM EDTA, 10 mM magnesium dichloride adjusted to pH = 7.4 + complete cocktail of protease inhibitor (Roche Diagnostics)). Homogenized with Polytron for 1 min and sonicated on ice for 2 x 2 minutes at 80% intensity (Vibracell sonicator). The preparation is centrifuged 20 min at 500 g at 4°C, the pellet is discarded and the supernatant centrifuged 1 hour at 43,000 g at 4°C (19,000 rpm). The pellet is resuspended in 12.5 ml Lysis buffer + 12.5 ml Sucrose 20% and homogenized using a Polytron for 1-2 min. The protein concentration is determined by the Bradford method and aliquots are stored at -80°C until use. For binding studies 60 mg Yttrium silicate SPA beads (Amersham) are mixed with an aliquot of membrane in binding buffer (50 mM Tris, 120 mM sodium chloride, 5 mM potassium chloride, 2 mM Calcium dichloride, 10 mM magnesium dichloride) for 15 minutes with mixing. 50 μl of bead/membrane mixture is then added to each well of a 96 well plate, followed by 50 μl of 4 nM 3H-Vasopressin (American Radiolabeled Chemicals). For total binding measurement 100 μl of binding buffer are added to the respective wells, for non-specific binding 100 μl of 8.4 mM cold vasopressin and for compound testing 100 μl of a serial dilution of each compound in 2% dimethyl sulfoxide. The plate is incubated 1 h at room temperature, centrifuged 1 min at 1000 g and counted on a Packard Top-Count. Non-specific binding counts are subtracted from each well and data is normalized to the maximum specific binding set at 100%. To calculate an IC 50 the curve is fitted using a non-linear regression model (XLfit) and the Ki is calculated using the Cheng-Prussoff equation.

The following representative data show the antagonistic activity against human V1a receptor of compounds according to present invention.

**Pharmaceutical Compositions**

The compounds of formula I as well as their pharmaceutically usable acid addition salts can be used as medicaments, e.g. in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered orally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions. The administration can, however, also be effected rectally, e.g. in the form of suppositories, or parenterally, e.g. in the form of injection solutions.

The compounds of formula I and their pharmaceutically usable acid addition salts can be processed with pharmaceutically inert, inorganic or organic excipients for the production of tablets, coated tablets, dragées and hard gelatine capsules. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts etc can be used as such excipients e.g. for tablets, dragées.
and hard gelatine capsules. Suitable excipients for soft gelatine capsules are e.g. vegetable oils, waxes, fats, semisolid and liquid polyols etc.

Suitable excipients for the manufacture of solutions and syrups are e.g. water, polyols, saccharose, invert sugar, glucose etc. Suitable excipients for injection solutions are e.g. water, alcohols, polyols, glycerol, vegetable oils etc. Suitable excipients for suppositories are e.g. natural or hardened oils, waxes, fats, semi-liquid or liquid polyols etc..

Moreover, the pharmaceutical preparations can contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other therapeutically valuable substances.

The dosage can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, in the case of oral administration a daily dosage of about 10 to 1000 mg per person of a compound of general formula I should be appropriate, although the above upper limit can also be exceeded when necessary.

The following examples illustrate the present invention without limiting it. All temperatures are given in degrees Celsius.

Examples

The following examples 1 – 69 are provided for illustration of the invention. They should not be considered as limiting the scope of the invention, but merely as being representative thereof.

Intermediate of formula (V)

cis/trans-4-Trimethylsilanyloxy-cyclohexane carboxylic acid ethyl ester (2:1)

To a solution of cis/trans-4-hydroxycyclohexane carboxylic acid ethyl ester (2:1) (5.0 g, 29 mmol) and imidazole (4.4 g, 64 mmol) in N,N-dimethylformamide (90 ml) was added trimethylsilyl chloride (4.0 ml, 32 mmol) at 0-5 °C. Stirring for 1 h at room temperature was
followed by partitioning between tert-butyl methyl ether (300 ml) and water (150 ml). The layers were separated. The organic layer was washed with two 150-ml portions of water and one 50-ml portion of brine, dried over anhydrous sodium sulfate and concentrated in vacuo to give the title compound (6.7 g, 94%) as colorless oil. MS m/e: 245 (M+H+).

4-Alkoxy-cyclohexanecarboxylic acid ester intermediates of formula (VII)

Reductive Etherification

General procedure I:

To a solution of cis/trans-4-trimethylsilyloxy-cyclohexanecarboxylic acid ethyl ester (2:1) in dichloromethane (0.1 M) are added consecutively a ketone or an aldehyde of formula (VI) (0.85 eq) and trimethylsilyl trifluoromethanesulfonate (0.10 eq) at -78 °C. The reaction mixture is stirred for 1 h. After addition of triethylsilane (1 eq) the cooling bath is removed and the reaction mixture is allowed to warm to room temperature. Stirring is continued over night. The mixture is quenched with saturated aqueous sodium bicarbonate solution. The layers are separated. The organic layer is dried over anhydrous sodium sulfate and concentrated in vacuo. Purification by flash-chromatography gives a 4-alkoxy-cyclohexanecarboxylic acid ester intermediate of formula (VII).

An alkoxy-trimethyl-silane intermediate of formula (IX) is formed in situ by adding trimethylsilyl trifluoromethanesulfonate (1 eq) to a solution of an alcohol derivative of formula (VIII) (1 eq) and 2,6-lutidine (1 eq) in dichloromethane (0.1 M) at -78 °C. After 1 h 4-cyclohexanonecarboxylic acid ethyl ester (X) (0.85 eq) and trimethylsilyl trifluoromethanesulfonate (0.1 eq) are added consecutively. The reaction mixture is stirred for 1 h. After addition of triethylsilane (2 eq) the cooling bath is removed and the reaction mixture is allowed to warm to room temperature. Stirring is continued over night. The mixture is quenched with saturated aqueous sodium bicarbonate solution. The layers are separated. The organic layer is dried over anhydrous sodium sulfate and concentrated in vacuo. Purification by flash-chromatography gives a 4-alkoxy-cyclohexanecarboxylic acid ester intermediate of formula (VII).

General procedure II B:

A trimethylsilyloxy intermediate of formula (IX), which is commercially available or which can be prepared according to methods known in the art, is dissolved in dichloromethane (0.1 M). 4-Cyclohexanonecarboxylic acid ethyl ester (X) (0.85 eq) and trimethylsilyl trifluoromethanesulfonate (0.1 eq) are added consecutively at -78 °C. The reaction mixture is stirred for 1 h. After addition of triethylsilane (2 eq) the cooling bath is removed and the reaction mixture is allowed to warm to room temperature. Stirring is continued over night. The mixture is quenched with saturated aqueous sodium bicarbonate solution. The layers are separated. The organic layer is dried over anhydrous sodium sulfate and concentrated in vacuo. Purification by
flash-chromatography gives a 4-alkoxy-cyclohexanecarboxylic acid ester intermediate of formula (VII).
